Two patients with progressive relapsing-remitting multiple sclerosis (MS) received infusions of autologous unfractionated hematopoietic stem cells (HSC) after nonmyeloablative conditioning. The patients had stable active disease that was being well controlled by a course of interferon beta-1b (IFN-beta) therapy. Autologous HSC were collected and cryopreserved by hematopoietic stem cell apheresis. The patients received 2 infusions of cryopreserved cells at 28-day intervals. Both patients reported minor side effects including fever and nausea and developed transient, self-limited hypogammaglobulinemia. No acute adverse events related to the infusions were observed. One patient experienced a minor relapse 2 weeks after the second infusion. Four years after the second infusion, the patient's functional disability was unchanged from pretreatment levels, and the patient was continuing to receive IFN-beta. The other patient reported no clinical relapses for 16 months after the second infusion. Because of the low level of evidence for the use of HSC infusions in MS, additional studies are needed to better define the safety and efficacy of these procedures. ApkTranslator is a complete, open source, pure Java multi-language API for android application translation which works on any platform, and it will be included to the play store as soon as it will be ready. ApkTranslator is a pure java project that runs and use java APIs to translate your source apk (it can work on all android devices and it can be extended to generate xapk too). ApkTranslator is an open source project, meaning: \* You can use it and improve it. \* You can include it in other projects. \* You can modify, make it easier, faster, or you can remove those features that you don't want All you need is to run a program that the ApkTranslator will launch (it is the most simple thing to do). After you launched it, you will be able to have the ApkTranslator API working as long as you want. The API will scan your source apk in the same folder and generate a new apk with a new filename with the same extension and everything you want to translate will be translated into english and added to the new file. You don't need to have any compiler toolkit in your project or any installed package to make it work, just only the ApkTranslator API. To make your 2edc1e01e8

#### What's New In?

This application can decode APK files and convert them into different languages by encoding resource files (file, string, int, long, etc.). These files are currently supported: ar, de, en, es, fr, he, hu, it, jp, ko, lt, nl, ru, sl, sv, tr, uk, zh. By decompiling the APK file, this application can also generate several other files, such as CertificatePem, res/raw/ etc. By generating these files, this application can install the APK file on a phone by decoding it and encrypting the resource files, so that the phone cannot be recognized by a third-party antivirus or antimalware tool. You can choose the file encoding method. It is possible to choose to use default values or to define your own. Furthermore, it is possible to save the method you have chosen in a folder so that you can use it later. You can also add translation files using an XML file format. In this case, you can save the
